Emergency Response, Medical Triage, and Cross-Agency Mission Coordination

AI-Assisted Mass Casualty Triage and Evacuation Prioritization

Jun 16, 2026

VOTES

Global Government Hackathon

[Back to all use cases](#)

Overview

Build a decision support prototype that helps medical and emergency response teams prioritize casualties, match patients to available care, and recommend evacuation options during a mass casualty event or distributed military operation.

The prototype should ingest available data such as casualty reports, vital signs, triage notes, blood availability, medical facility capacity, evacuation platform availability, route status, weather, and mission constraints. The tool should recommend casualty prioritization, destination selection, and evacuation sequencing while keeping a human decision-maker in control.

Profile

More

The system should be explainable, auditable, and resilient in degraded communications environments. The goal is to help responders make faster and more consistent decisions when casualty volume, transportation constraints, and limited medical resources create life-or-death prioritization challenges.

★ Evaluation Criteria

- Innovation (25%): Does the solution differ meaningfully from existing approaches in the market? How creative and novel is the problem-solving methodology? What unique value proposition does this technical approach offer?
- Working Solution (30%): How complete is the working prototype or proof of concept? Does the solution actually solve the intended problem using AWS services effectively? Was the solution tested and validated with clear success metrics?
- Architecture and Integration (20%): Does the solution effectively leverage both edge and cloud computing? Are system boundaries clearly defined with well-documented interfaces? How modular is the solution and how easily can partners integrate?
- Security and Feasibility (15%): Are appropriate security and compliance measures implemented? Is the deployment timeline realistic and the solution maintainable? How does the solution scale while maintaining performance?
- Documentation and Path Forward (10%): Are assumptions, constraints, and limitations clearly documented? Is there a clear cost analysis and optimization strategy? What future improvements are planned and what lessons were captured?

Emergency Response, Medical Triage, and Cross-Agency Mission Coordination

This category focuses on helping government, defense, and public safety teams coordinate people, resources, medical capacity, transportation, and response actions during fast-moving emergencies. Teams should build prototypes that support human decision-making, improve prioritization, and enable better coordination across agencies, locations, and mission partners.
